Proxy (Surrogate)

a person authorized to act on behalf of another
class Proxy {
    AbstractSubject realSubject;

    public Foo service(Bar x) {
        return realSubject(x);
    }
}
Why do it?
String server = getHelloHostAddress( args);
Hello proxy = (Hello) Naming.lookup( server );
String message = proxy.sayHello();
System.out.println( message );
class Proxy {
    AbstractSubject realSubject;

    public Foo service(Bar x) {
        some preprocessing
        result = realSubject(x);
        some postprocessing
    }
}
Virtual Proxy

Creates/accesses expensive objects on demand
Java's Synchronized List

ArrayList notSafe = new ArrayList();
List threadSafe = Collections.synchronizedList(notSafe);

static class SynchronizedList {
    List list;
    public Object get(int index) {
        synchronized(mutex) {return list.get(index);}
    }
}
Java's Unmodifable List

ArrayList notSafe = new ArrayList();
List noChange = Collections.unmodifiableList(notSafe);

static class UnmodifiableList {
    List list;
    public Object get(int index) { return list.get(index);}

    public Object set(int index, Object element) {
        throw new UnsupportedOperationException();
    }
}
Proxy or Decorator?

ArrayList notSafe = new ArrayList();
List noChange = Collections.unmodifiableList(notSafe);
List threadSafe = Collections.synchronizedList(noChange);
Proxy verses Decorator

"Decorators can have similar implementations as proxies"

Proxy controls access to an object

Decorator adds one or more responsibilities to an object
Smalltalk Proxy Trick

Object subclass: #Proxy
  instanceVariableNames: 'target '
  classVariableNames: "
  poolDictionaries: "
  category: 'Whitney-Examples'

  
  
  
Class Method

on: anObject
  ^super new target: anObject

Instance Methods

doesNotUnderstand: aMessage
  ^target
    perform: aMessage selector
    withArguments: aMessage arguments

  
  
  
  target: anObject
  target := anObject

| wrapper |
wrapper := Proxy on: Transcript.
wrapper open.
wrapper show: 'Hi mom'.

| wrapper |
wrapper := Proxy on: 3.
wrapper + 5.

| wrapper |
wrapper := Proxy on: 'Hi '.
wrapper , ' mom'.
State Pattern

Allow an object to alter its behavior when its internal state changes

The object will appear to change its class
Oracle seer = new Truthful();
 blah
 seer = new Lying();
Hide state transitions from clients

Multiple references to same object
Context
  state
    request()
  state->handle()

State
  handle()

ConcreteStateA
  handle()

ConcreteStateB
  handle()
Who defines state Transitions - Context

class Context {
    private AbstractState state = new StartState();

    public Bar foo(int x) {
        int result = state.foo(x);
        if (someConditionHolds() )
            state = nextState();
        return result;
    }
}
Who defines state Transitions - States

class Context {
    private AbstractState state = new StartState();

    public void foo(int x) {
        state = state.foo(x);
    }

    What if foo returns a value?
Who defines state Transitions - States

class Context {
    private AbstractState state = new StartState();

    public int foo(int x) {
        return state.foo(x, this);
    } 

    protected void setState(AbstractState newState) {
        state = newState;
    } 
}
Sharing State Objects

Stateless state
  State objects without fields
  Can be shared by multiple contexts

Can store date in context and pass as arguments

Large number of state transitions can be expensive

  Only create state once & reuse same object
Changing Class - No Need for Context

class Truthful extends Oracle {

    public boolean foo(int x) {
        int result = state.foo(x);
        this.changeClassTo(Random);
        return result;
    }
}
State Verses Strategy
Rate of Change

**Strategy**
Context usually contains just one strategy object

**State**
Context often changes state objects
State Verses Strategy

Exposure of Change

**Strategy**

Strategies all do the same thing

Client do not see change in behavior of Context

**State**

States act differently

Client see the change in behavior
Factory Method

A template method for creating objects

public class Example {
    protected Bar bar() { return new Bar(); }

    public void foo() {
        blah
        Bar soap = bar();
        blah;
    }
}
