Java On-line API http://java.sun.com/j2se/1.5.0/docs/api/index.html

TCP/IP Illustrated Vol 1, Stevens, 1994, chapter 20.

Socket Options

Timeouts
Buffer Size
Multi-Homing
No Delay for small data
Linger on close
Keep-Alive
Urgent-Data
Timeouts

Socket will time out after specified time of inactivity

Java

Both Socket and ServerSocket class support:

    void setSoTimeout(int timeoutInMilliseconds) throws SocketException
    void getSoTimeout() throws SocketException

Must be sent before performing a read

Read throws SocketTimeoutException when socket times out

Not normally used on ServerSockets
Buffer Size

Each TCP socket has

- Receive buffer
- Send Buffer

Buffers are in the TCP stack space (not the VM)

Buffer size should:

- Be at least 16KB on Ethernet
  Applications that send lots of data use 48KB or 64KB

TCP does not allow the sender to overflow the receiver’s buffer

So the receiver’s receive buffer as large as the sender’s send buffer

Buffers larger than 64KB require special set up
import java.net.*;
import java.io.*;
import java.util.Date;

public class ServerWithTimeout extends Thread {
    static final int CLIENT_TIMEOUT = 3 * 1000; // in milliseconds
    static final int BUFFER_SIZE = 16 * 1024;
    ServerSocket acceptor;

    public static void main(String[] args) throws IOException {
        int port = Integer.parseInt( args[1]);

        ServerWithTimeout server = new ServerWithTimeout( port );
        server.start();
    }

    public ServerWithTimeout(int port ) throws IOException {
        acceptor = new ServerSocket(port);
        acceptor.setReceiveBufferSize( BUFFER_SIZE );
    }
}
public void run() {
    while (true) {
        try {
            Socket client = acceptor.accept();
            processRequest( client );
        }
        catch (IOException acceptError){
            // for a later lecture
        }
    }
}

void processRequest( Socket  client) throws IOException {
    try {
        client.setReceiveBufferSize( BUFFER_SIZE);
        client.setSoTimeout( CLIENT_TIMEOUT);
        processRequest( client.getInputStream(),
                       client.getOutputStream());
    }
    finally {
        client.close();
    }
}
void processRequest(InputStream in, OutputStream out) throws IOException {
    BufferedReader parsedInput = null;
    PrintWriter parsedOutput = null;
    try {
        parsedInput = new BufferedReader(new InputStreamReader(in));
        parsedOutput = new PrintWriter(out, true);

        String inputLine = parsedInput.readLine();

        if (inputLine.startsWith("date")) {
            Date now = new Date();
            parsedOutput.println(now.toString());
        }
    }
    catch (SocketTimeoutException clientTooSlow) {
        parsedOutput.println("Connection timed out");
    }
}
Nagle’s Algorithm

Delays transmission of new TCP packets while any data remains unacknowledged

Allows TCP to merge data into larger packets before sending

Introduced to avoid lots of small packets across a WAN

Delay is on by default

class Socket
{
    void setTcpNoDelay(Boolean noDelay) throws SocketException
    void getTcpNoDelay() throws SocketException
}
Linger on Close

Determines what happens when a socket is closed

How long does the socket remain after being closed

  Acknowledge packets
  Retransmit lost packets

Default is to

  Allow the application to continue
  TCP handles sending unsent data & rejecting new requests
Keep Alive

Send packet on inactive connection to prevent timeouts

At least 2 hour delay between sending keep alive packets

Long delay limits its usefulness
Urgent (Out of Band) Data

Urgent data can be read out of order

Read before data that was sent before it

Java

Supports sending of urgent data

Does not promote urgent data in the input stream
