# Rename Class

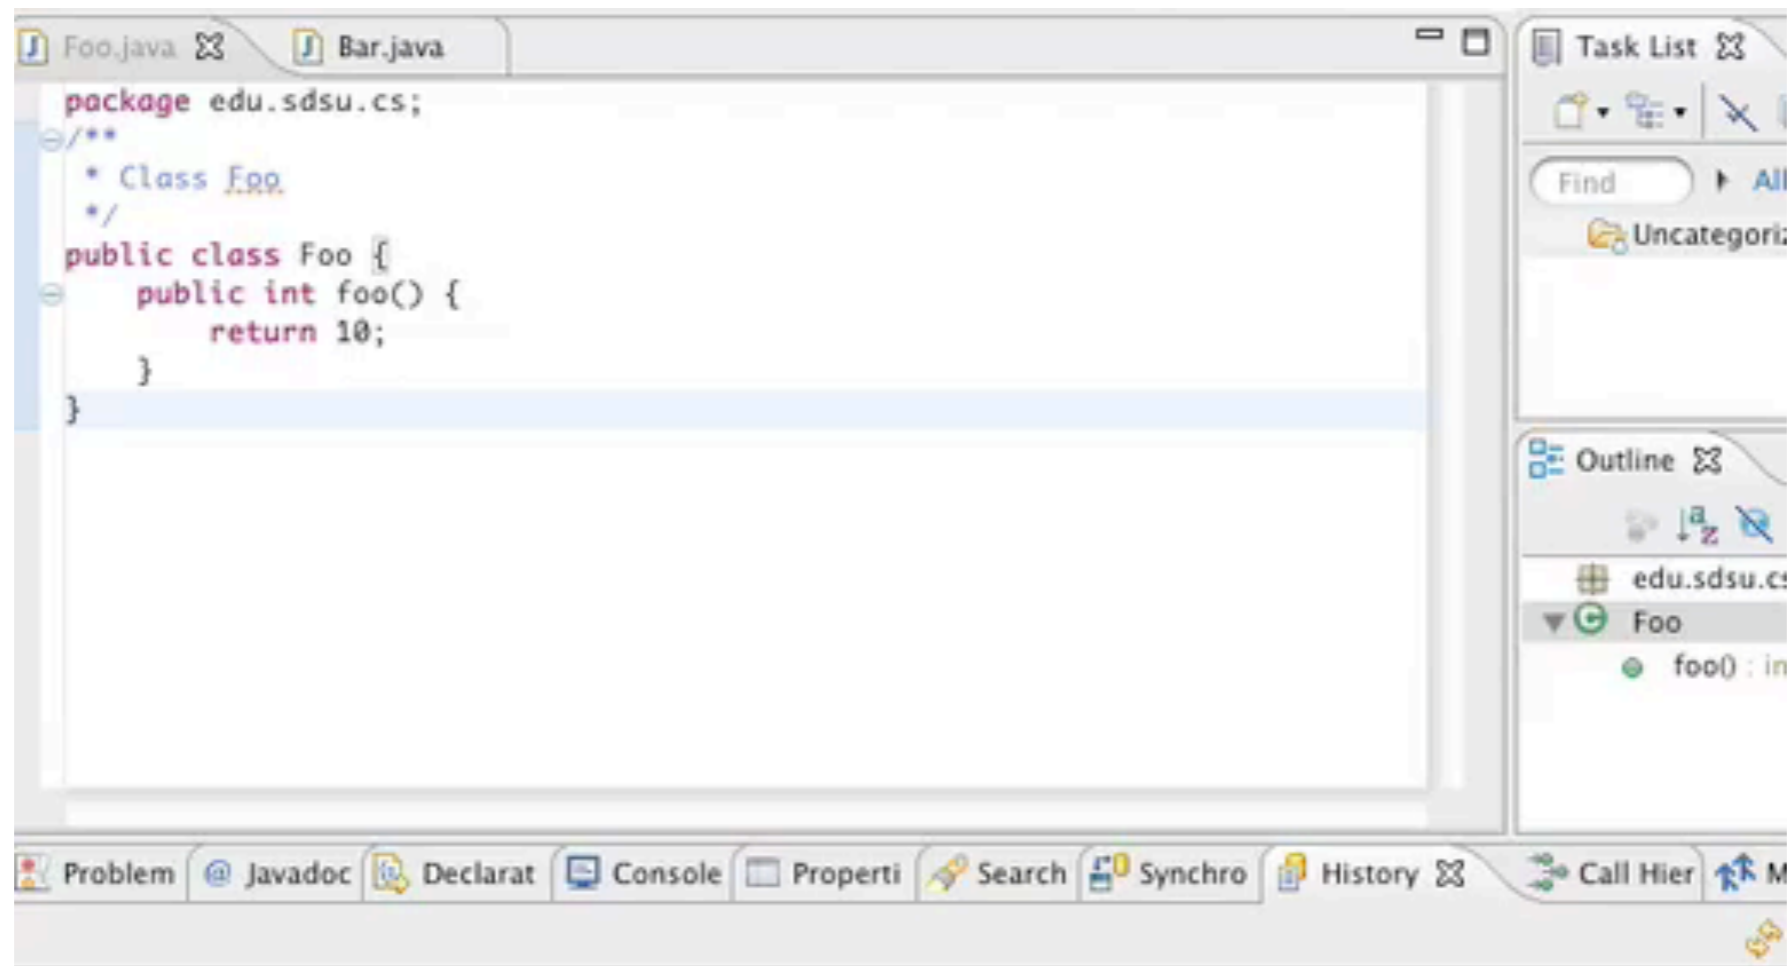

```
public class Foo {  
    public int foo() {  
        return 10;  
    }  
}
```

```
public class NewFoo {  
    public int foo() {  
        return 10;  
    }  
}
```

```
public class Bar {  
    public int bar() {  
        Foo test = new Foo();  
        return test.foo() + 99;  
    }  
}
```

```
public class Bar {  
    public int bar() {  
        NewFoo test = new NewFoo();  
        return test.foo() + 99;  
    }  
}
```

# Eclipse Rename

# Move

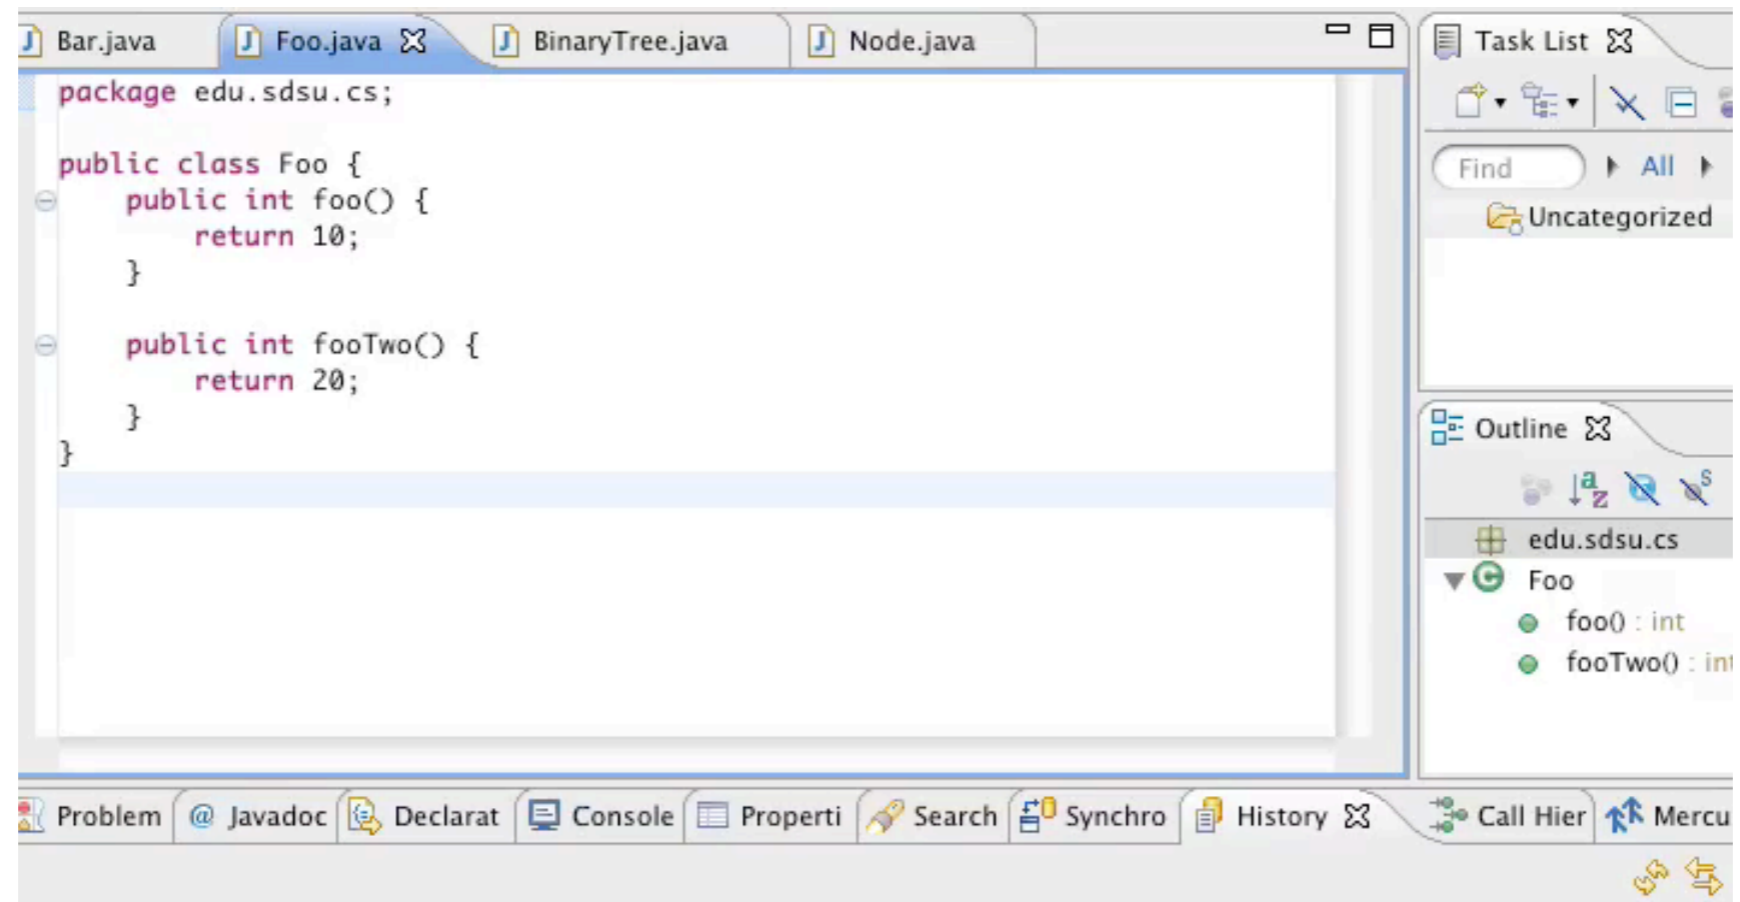

```
public class Bar {  
    public int helperMethod(Foo test) {  
        return test.foo() + test.fooTwo();  
    }  
  
    public int callHelper() {  
        Foo data = new Foo();  
        return helperMethod(data);  
    }  
}
```

```
public class Foo {  
    public int foo() { return 10;}  
  
    public int fooTwo() { return 20; }  
}
```

```
public class Bar {  
    public int callHelper() {  
        Foo data = new Foo();  
        return data.sum();  
    }  
}  
  
public class Foo {  
    public int foo() { return 10;}  
  
    public int fooTwo() {return 20; }  
  
    public int sum() {  
        return foo() + fooTwo();  
    }  
}
```

# Eclipse Move

# Extract Class

The screenshot shows an IDE window titled 'BinaryTree.java' with the following code:

```
package edu.sdsu.cs;  
  
public class BinaryTree {  
    private BinaryTree root;  
    private String value;  
    private BinaryTree left;  
    private BinaryTree right;  
  
    public boolean hasValue(String value) {  
        return hasValue(root, value);  
    }  
  
    private boolean hasValue(BinaryTree tree, String value) {  
        if (0 == tree.value.compareTo(value))  
            return true;  
        if (-1 == tree.value.compareTo(value))  
            return hasValue(tree.right, value);  
        if (0 == tree.value.compareTo(value))
```

The IDE interface includes a 'Task List' panel on the right with a 'Find' search bar and an 'Uncategoriz' button. Below it is an 'Outline' panel showing a tree structure for 'BinaryTree' with nodes for 'root : Bin', 'value : St', 'left : Bin', and 'right : Bi'. At the bottom, a toolbar contains icons for 'Problem', '@ Javadoc', 'Declarat', 'Console', 'Properti', 'Search', 'Synchro', 'History', 'Call Hier', and 'M'. The status bar at the very bottom displays 'Writable', 'Smart Insert', and '2 : 1'.

# Refactoring Tool Issue

People tend to only use the features they know

# Refactoring Tool Issue

Is a tool hard to use because I am unfamiliar with it or is it just hard to use

# Refactoring by 41 Professional Programmers

	Number of Programmers used Refactoring	Total Times used
IntroduceFactory	1	1
PushDown	1	1
UseSupertype	1	6
EncapsulateField	2	5
Introduce Parameter	3	25
Convert Local to Field	5	37
Extract Interface	10	26
Inline	11	185
Modify Parameters	11	79
Pull up	11	37
Extract Method	20	344
Move	24	212
Rename	41	2396

# Try In Eclipse

Rename

Move

Encapsulate Field

Extract Method

Extract Class

# Decorator

# Prime Directive Data + Operations

# Decorator Pattern

Adds responsibilities to individual objects

Dynamically  
Transparently

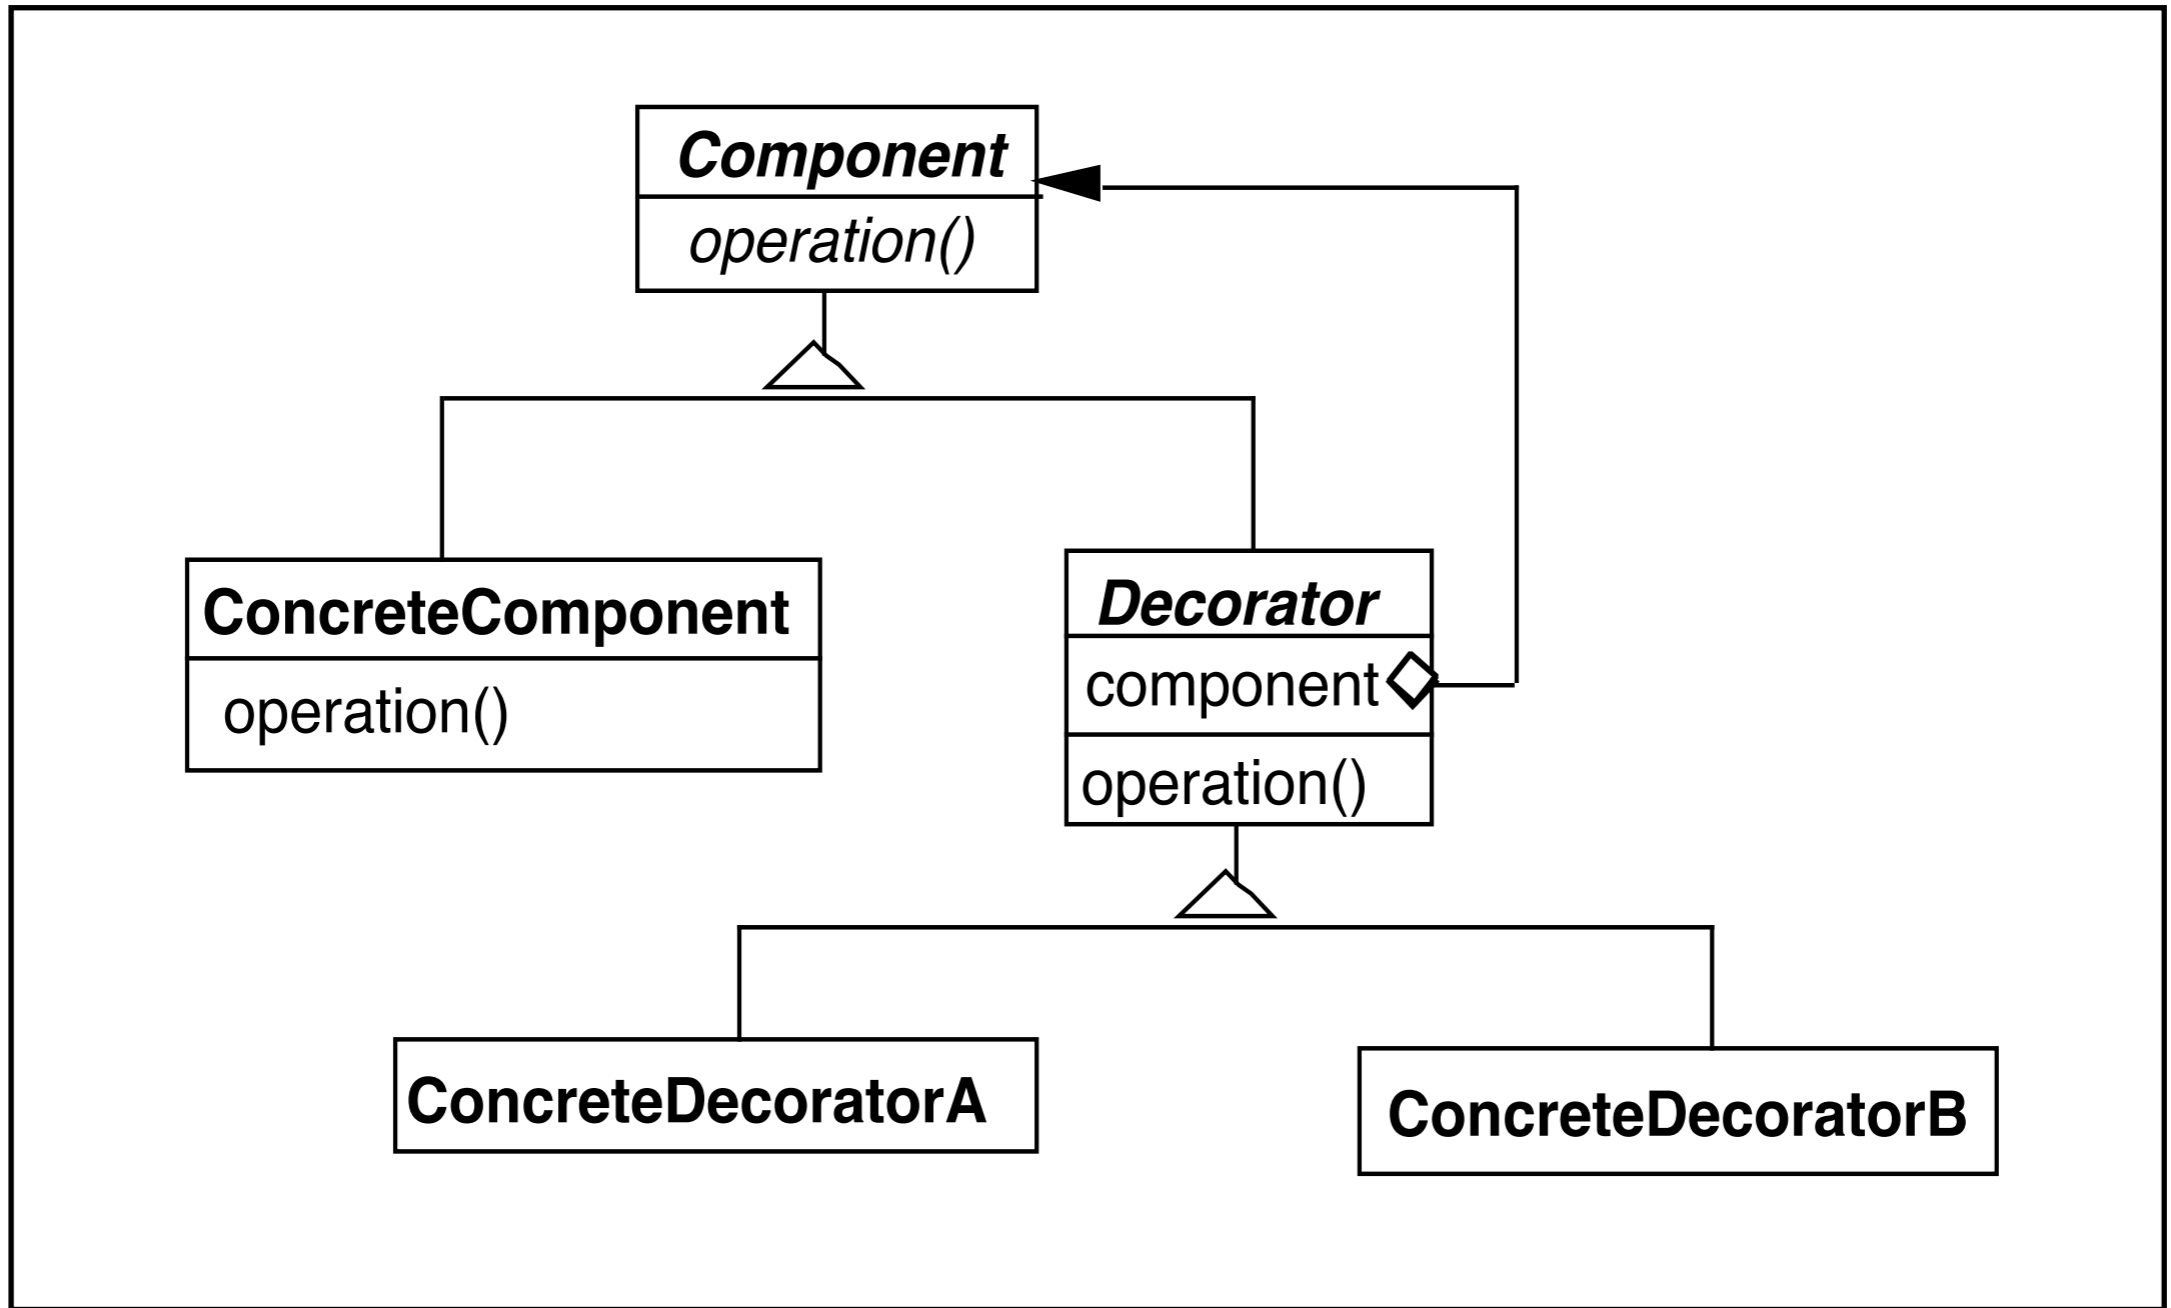

```

import java.io.*;
import sdsu.io.*;
class ReadingFileExample
{
public static void main( String args[] ) throws Exception
{
FileInputStream inputFile;
BufferedInputStream bufferedFile;
ASCIIInputStream cin;

inputFile = new FileInputStream( "ReadingFileExample.java" );
bufferedFile = new BufferedInputStream( inputFile );
cin = new ASCIIInputStream( bufferedFile );
}
}

```

Decorator forwards all component operations

# Favor Composition over Inheritance

# Refactoring: Move Embellishment to Decorator

# Benefits & Liabilities

## Benefits

Simplifies a class

Distinguishes a classes core responsibilities from embellishments

## Liabilities

Changes the object identity of a decorated object

Code harder to understand and debug

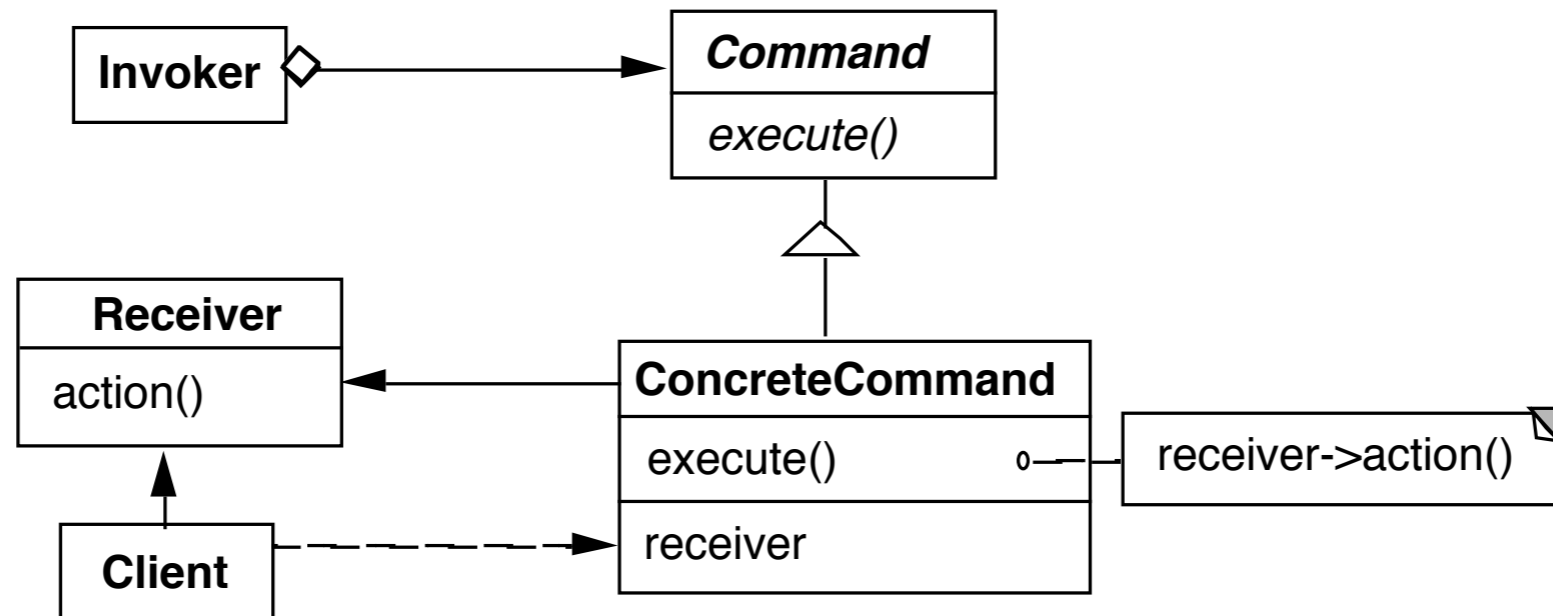

Combinations of decorators may not work correctly together

# Command

# Command

Encapsulates a request as an object

## Example

Invoker be a menu

Client be a word processing program

Receiver a document

Action be save

# When to Use the Command Pattern

Need action as a parameter (replaces callback functions)

Specify, queue, and execute requests at different times

Undo

Logging changes

High-level operations built on primitive operations

A transaction encapsulates a set of changes to data

Systems that use transaction often can use the command pattern

Macro language

# Callback Function vs Command

Command contains reference to object that it acts on

# Consequences

Command decouples the object that invokes the operation from the one that knows how to perform it

It is easy to add new commands, because you do not have to change existing classes

You can assemble commands into a composite object

# Refactoring: Replace Conditional Dispatcher with Command

```
public class SDSUChatServer {  
    public void processClientRequest(String request) {  
        blah  
        if (command.equals("quit"))  
            quit();  
        else if (command.equals("register"))  
            registerNewUser(commandData);  
        else if (command.equals("login"))  
            login(commandData);  
        else if (command.equals("nickname"))  
            checkNickname(commandData);  
        blah  
    }  
}
```

```
action = actions.get(command);  
action.execute(commandData);
```

# Sample Command

```
public class RegisterCommand extends Command {
    private SDSUChatServer target;

    public RegisterCommand(SDSUChatServer aServer) {
        target = aServer;
    }

    public void execute(String commandData) {
        target.registerNewUser(commandData);
    }
}
```

# The actions table

```
public class SDSUChatServer {  
    private HashMap<String, Command> actions;  
  
    private populateActions() {  
        actions = new HashMap<String, Command>();  
        actions.put("quit", new QuitCommand(this));  
        actions.put("register", new RegisterCommand(this));  
        actions.put("login", new LoginCommand(this));  
        actions.put("nickname", new NicknameCommand(this));  
    }  
}
```

# When to do this?

Need runtime flexibility

Conditional Dispatcher is bloated

# Pluggable Commands

Can create one general Command using reflection

Don't hard code the method called in the command

Pass the method to call an argument

# Java Example of Pluggable Command

```
import java.util.*;
import java.lang.reflect.*;

public class Command
{
    private Object receiver;
    private Method command;
    private Object[] arguments;

    public Command(Object receiver, Method command,
                  Object[] arguments )
    {
        this.receiver = receiver;
        this.command = command;
        this.arguments = arguments;
    }

    public void execute() throws InvocationTargetException,
                               IllegalAccessException
    {
        command.invoke( receiver, arguments );
    }
}
```

# Using the Pluggable Command

```
public class Test {  
    public static void main(String[] args) throws Exception  
    {  
        Vector sample = new Vector();  
        Class[] argumentTypes = { Object.class };  
        Method add =  
            Vector.class.getMethod( "addElement", argumentTypes);  
        Object[] arguments = { "cat" };  
  
        Command test = new Command(sample, add, arguments );  
        test.execute();  
        System.out.println( sample.elementAt( 0));  
    }  
}
```

<b>Output</b>
cat
36

# Command Processor Pattern

# Command Processor Pattern

Command Processor manages the command objects

The command processor:

- Contains all command objects

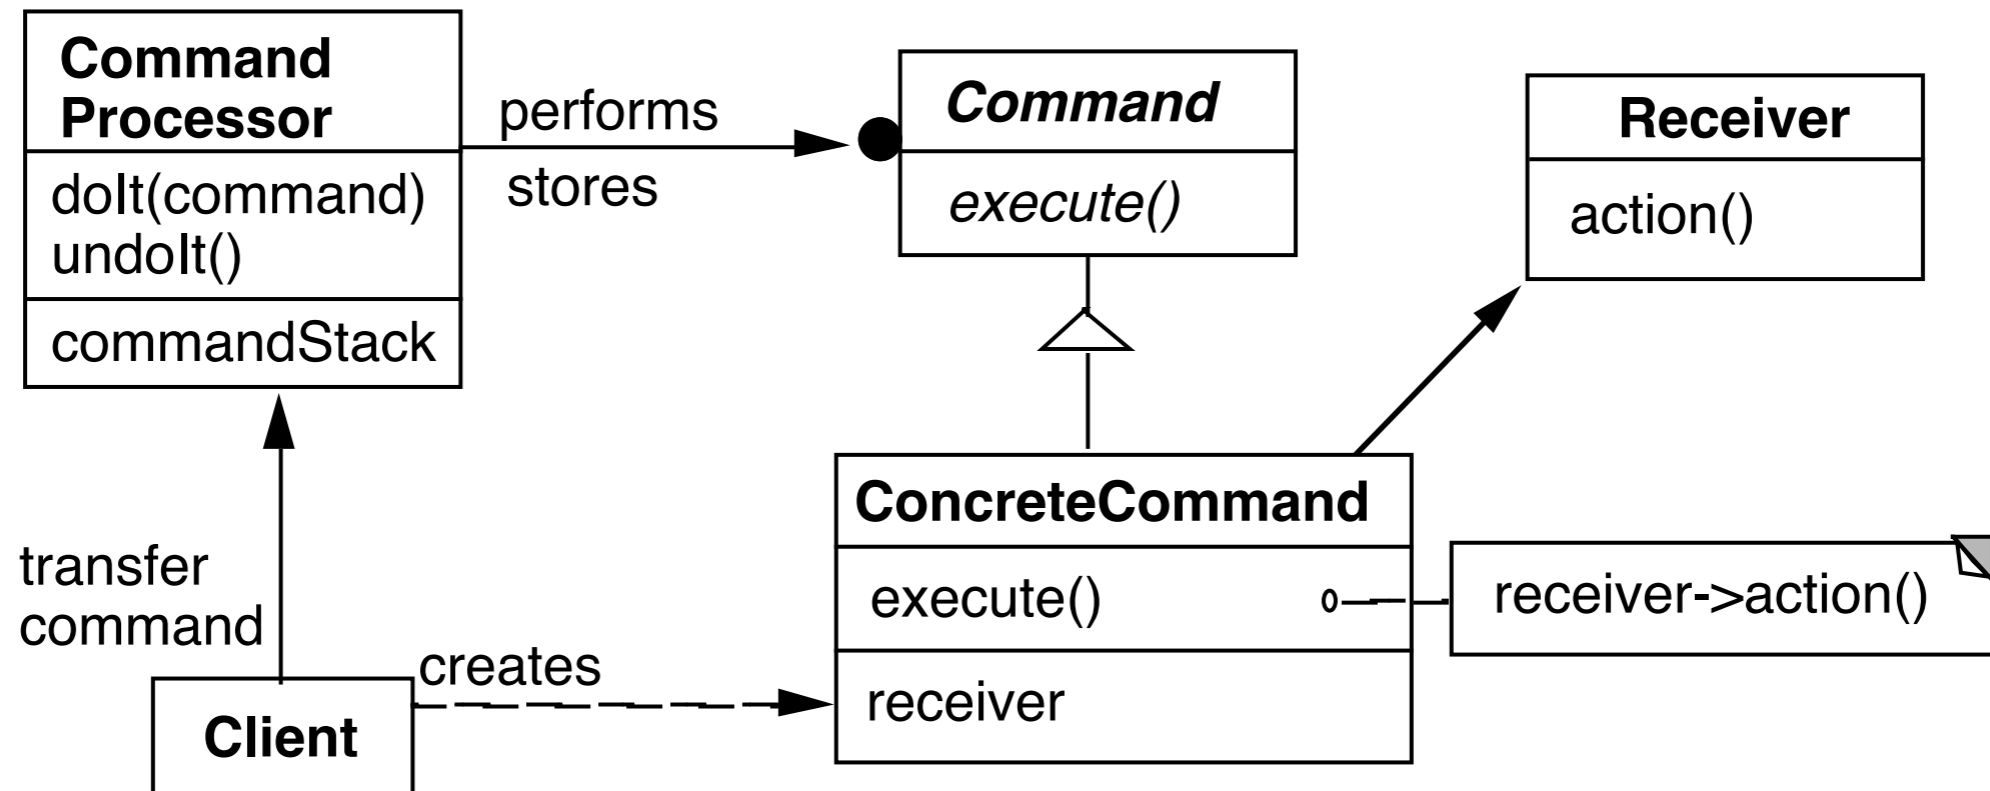

- Schedules the execution of commands

- May store the commands for later unto

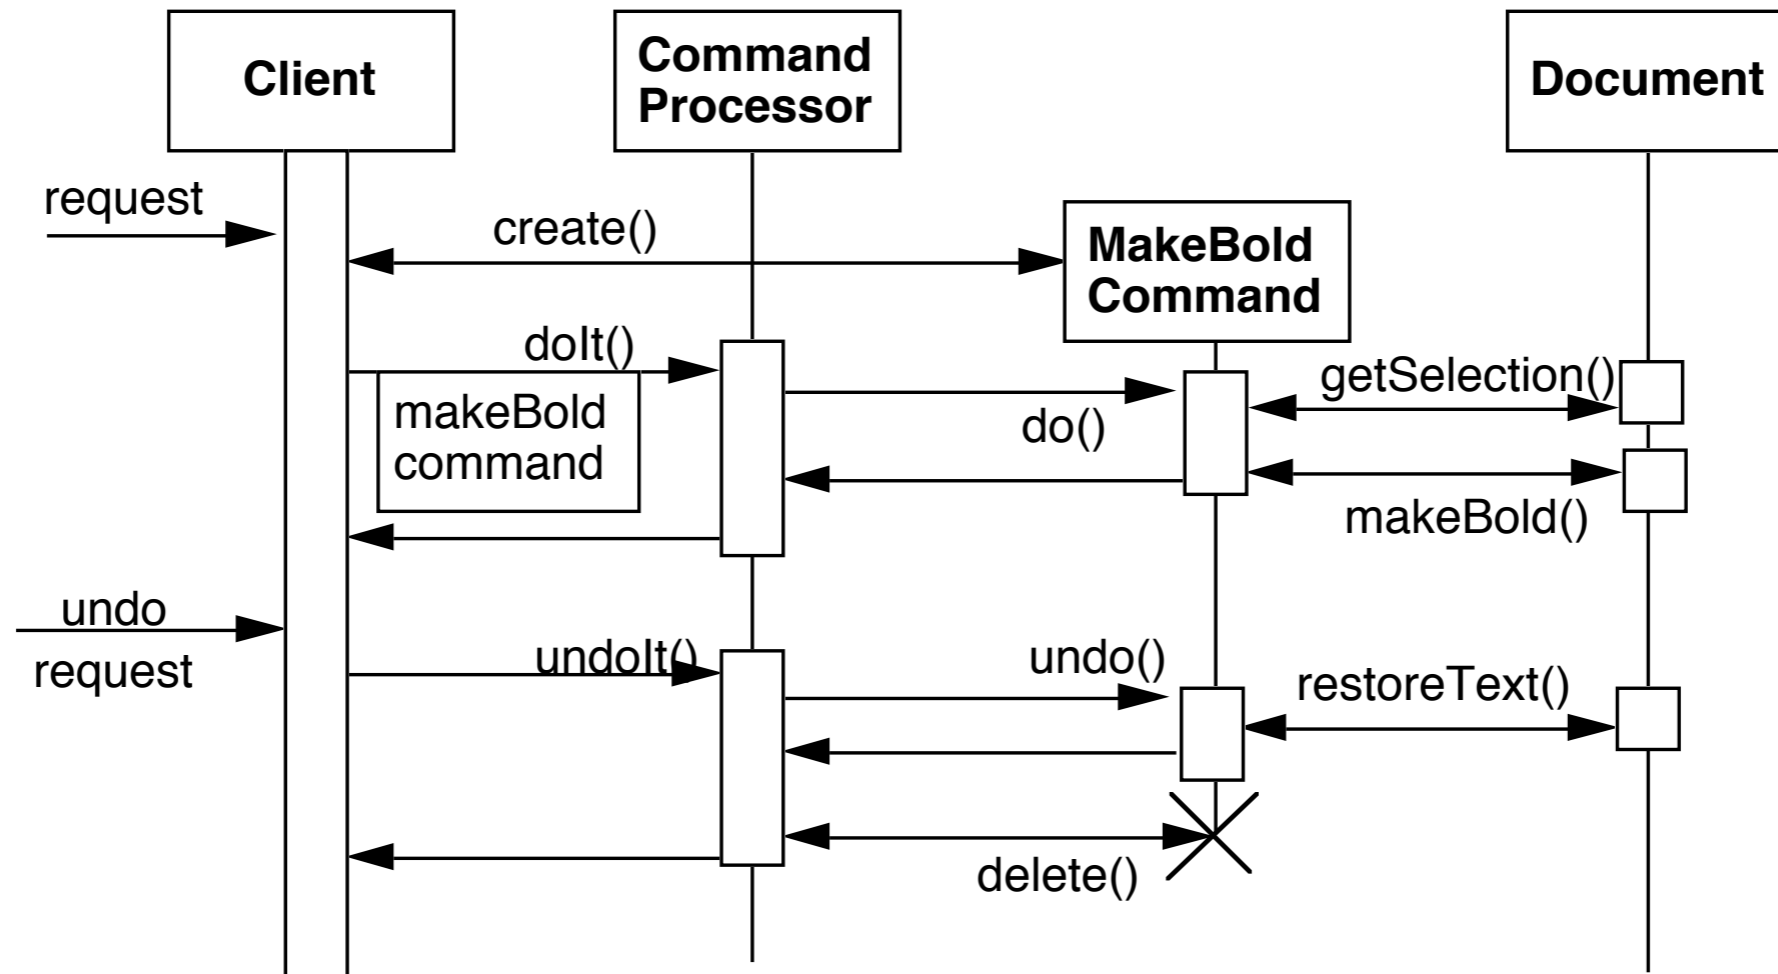

- May log the sequence of commands for testing purposes

- Uses singleton to insure only one instance

# Structure

# Dynamics

# Benefits

Flexibility in the way requests are activated

Different user interface elements can generate the same kind of command object

Allows the user to configure commands performed by a user interface element

Flexibility in the number and functionality of requests

Adding new commands and providing for a macro language comes easy

Programming execution-related services

Commands can be stored for later replay

Commands can be logged

Commands can be rolled back

Testability at application level

Concurrency

Allows for the execution of commands in separate threads

# Liabilities

Efficiency loss

Potential for an excessive number of command classes

Try reducing the number of command classes by:

- Grouping commands around abstractions

- Unifying simple commands classes by passing the receiver object as a parameter

Complexity

How do commands get additional parameters they need?
