# Scikit Learn

<https://scikit-learn.org/stable/index.html>

Common Python Machine Learning library

Included in anaconda jupyter notebook install

## Basic Operation

Choose which model to use

Choose model hyperparameters

Arrange data into a features matrix and target vector

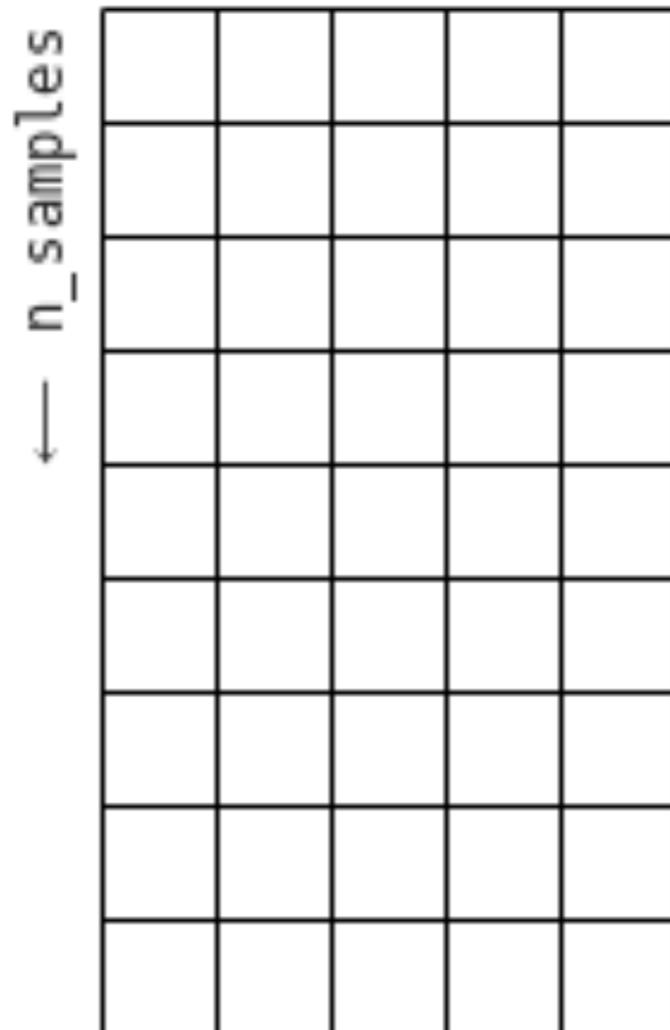

Fit the model to data using fit()

Apply the model to new data

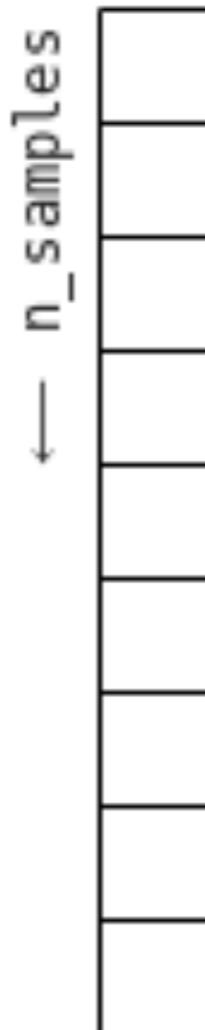

# Feature Matrix & Target Vector

Feature Matrix ( $X$ )

$n\_features \rightarrow$

Target Vector ( $y$ )

Feature Matrix - independent variables

Target Vector - dependent variable

```
import numpy as np
from sklearn.linear_model import LinearRegression
```

```
rng = np.random.RandomState(42)
x = 10 * rng.rand(50)
y = 2 * x - 1 + rng.randn(50) # y = Target Vector
```

```
X = x[:,np.newaxis] # X = Feature matrix
```

X	x	y
array([[3.74540119],	array([3.74540119,	array([ 7.22926896,
[9.50714306],	9.50714306,	18.18565441,

# Bayes Theorem

$P(A)$  = probability of A

$P(B)$  = probability of B

$P(A | B)$  = probability of A given B is true

$P(B | A)$  = probability of B given A is true

	Female	Male	Total
Teacher	8	12	20
Student	32	48	80
Total	40	60	100

$$P(A | B) = P(B | A) * P(A) / P(B)$$

$P(\text{Teacher} | \text{Male})$  ?

$$P(\text{Male} | \text{Teacher}) = 12/20$$

$$P(\text{Teacher}) = 20/100$$

$$P(\text{Male}) = 60/100$$

$$\begin{aligned} P(\text{Teacher} | \text{Male}) &= P(\text{Male} | \text{Teacher}) * P(\text{Teacher}) / P(\text{Male}) \\ &= 12/20 * 20/100 / (60/100) \\ &= 12/20 * 20/100 * 100/60 \\ &= 12/20 * 20 / 60 \\ &= 12/20 * 2/6 \\ &= 12/20 * 1/3 \\ &= 12/60 \end{aligned}$$

# Classification

Given a datum which group does it belong

Give each group a label (identifier)

Given a datum label should it have

# Bayesian Classification

$$P(A | B) = P(B | A) * P(A) / P(B)$$

$$P(\text{Label} | \text{features}) = P(\text{features} | \text{Label}) * P(\text{Label}) / P(\text{features})$$

If we have two labels

$$P(L1 | \text{features}) / P(L2 | \text{features}) = P(\text{features} | L1) * P(L1) / (P(\text{features} | L2) * P(L2))$$

$P(\text{features} | L_i)$

Need a model of how the data is generated to compute this

# Gaussian Naive Bayes

Data from each label is drawn from a simple Gaussian distribution

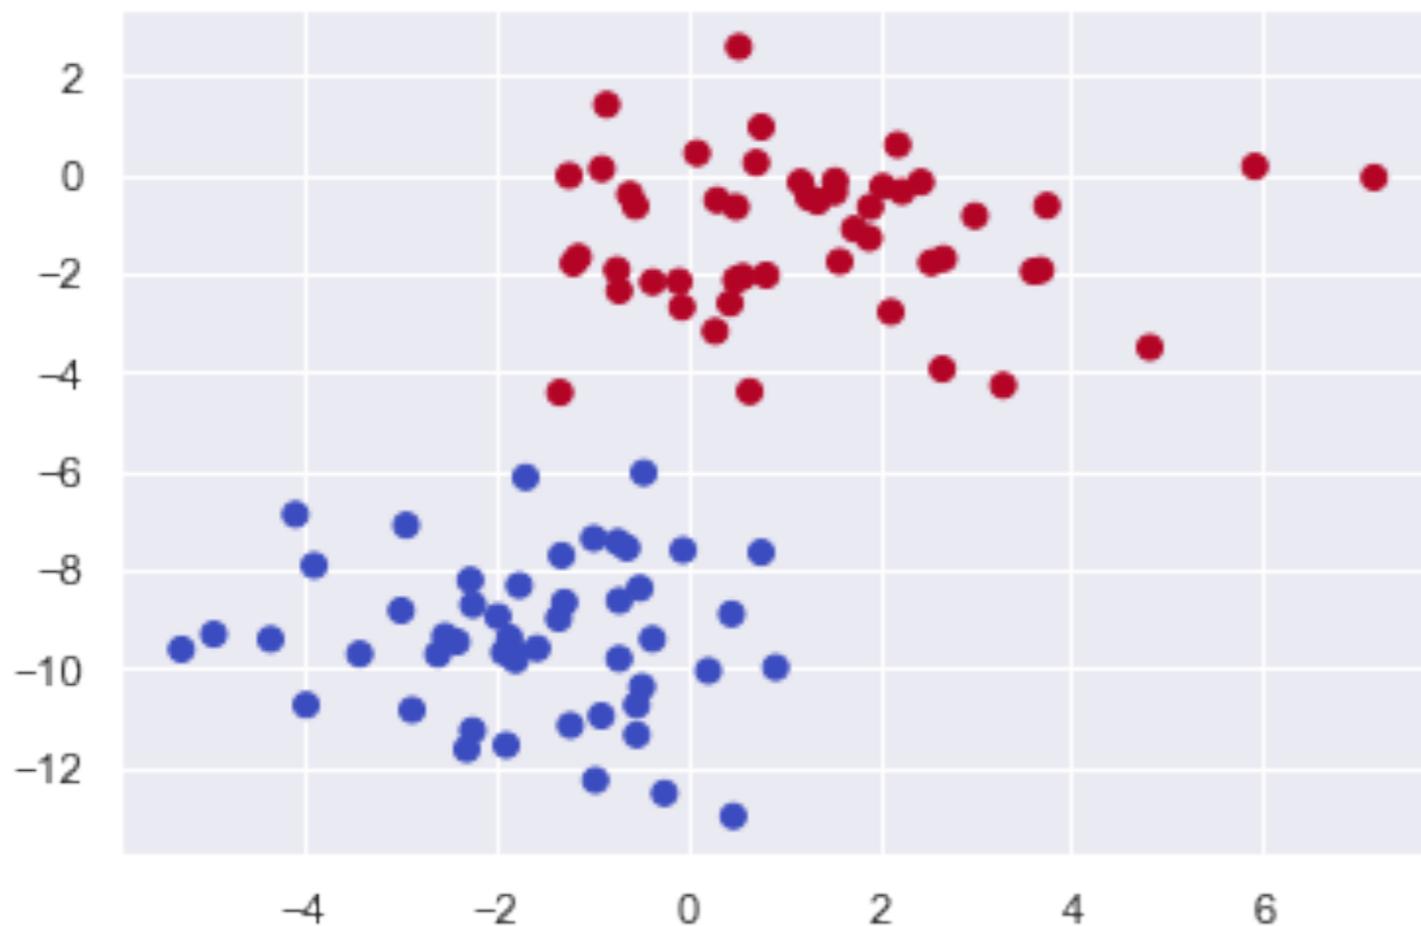

Naive

Because we are making assumption about the distribution

# Some Data

```
import numpy as np
import matplotlib.pyplot as plt
from sklearn.datasets import make_blobs
```

```
X, y = make_blobs(100, 2, centers=2, random_state=2, cluster_std=1.5)
plt.scatter(X[:, 0], X[:, 1], c=y, cmap='coolwarm');
```

```
y[0:5]      array([0, 0, 0, 1, 1])
```

```
X[0:5]
```

```
array([[ 0.92141506, -9.98499137],
       [-5.26927614, -9.6186543 ],
       [-0.45292089, -6.04316334],
       [-0.0856312 , -2.16867404],
       [ 1.53194956, -0.36022153]])
```

```
sklearn.datasets.make_blobs(  
    n_samples=100,  
    n_features=2,  
    centers=None,           #The number of centers to generate  
    cluster_std=1.0,  
    center_box=(-10.0, 10.0),  
    shuffle=True,  
    random_state=None)    #Determines random number generation
```

## Returns

X

generated samples

y

Integer labels for the clusters

```
matplotlib.pyplot.scatter(x, y,  
    s=None,  
    c=None,  
    marker=None,  
    cmap=None,  
    norm=None, vmin=None, vmax=None, alpha=None, linewidths=None,  
    verts=None, edgecolors=None, *, plotnonfinite=False, data=None, **kwargs)
```

`s` : scalar or array\_like, shape (n, ), optional

`c` : color, sequence, or sequence of color, optional

A sequence of color specifications of length n.

A sequence of n numbers to be mapped to colors using `cmap` and `norm`

# Training the Model

```
from sklearn.naive_bayes import GaussianNB
model = GaussianNB()
model.fit(X, y)
```

Test Data

```
rng = np.random.RandomState(0)
Xnew = [-6, -14] + [14, 18] * rng.rand(2000, 2)
```

X values [-6, 8]  
Y values [-14, 4]

```
pairs = rng.rand(3, 2)
[-10, 50]* pairs
```

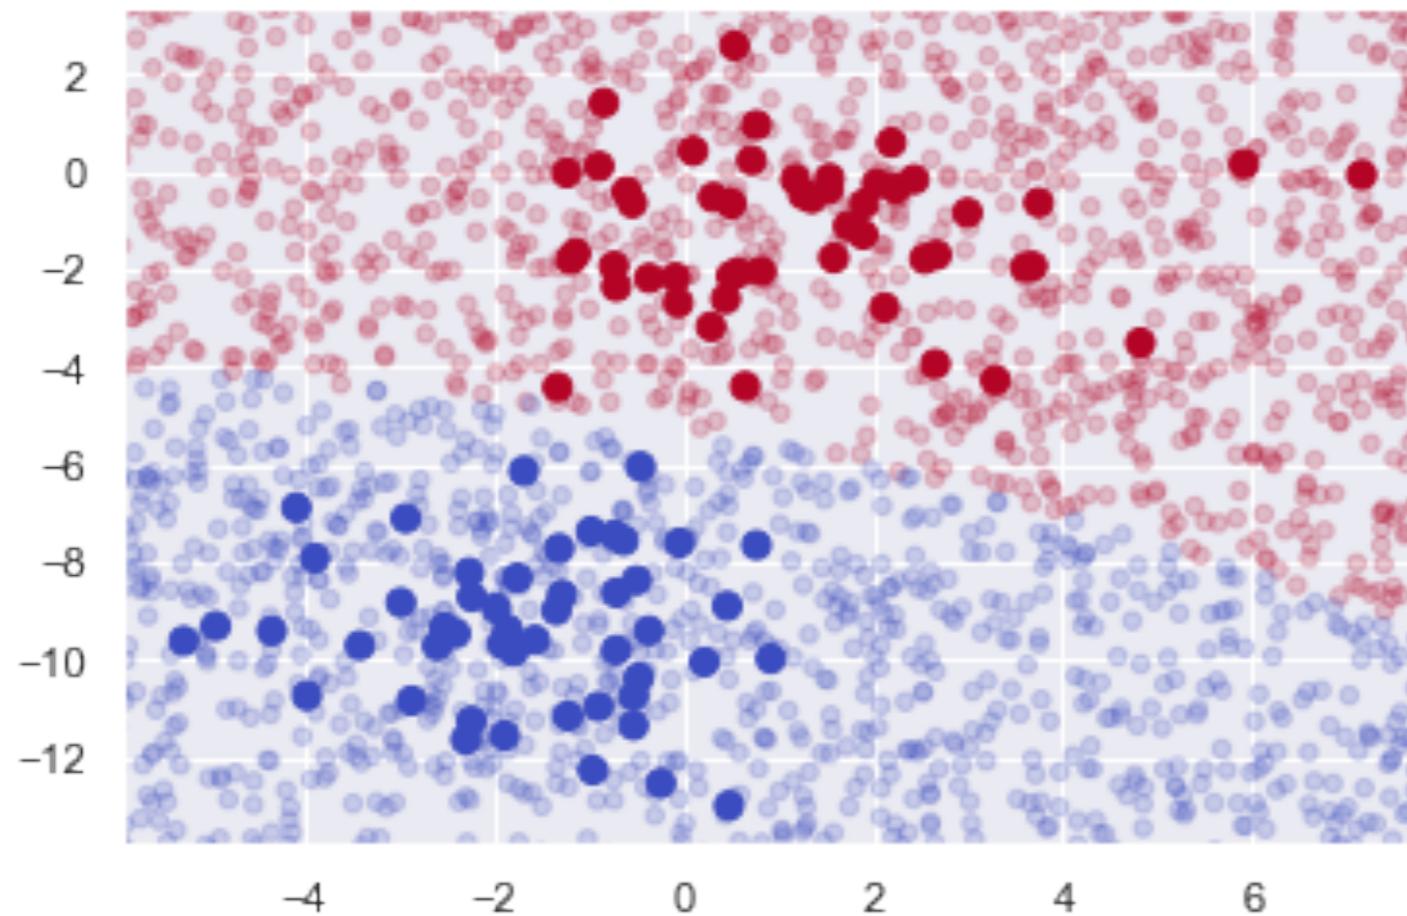

```
array([[ -9.47419519, 43.23204192],
       [-6.16054049, 42.07036184],
       [-2.09692145, 43.70144114]])
```

Xnew[0:4]

```
array([[ 1.68338905, -1.12659141],
       [ 2.43868727, -4.19210271],
       [-0.06883281, -2.37390596],
       [ 0.12622096,  2.05191401]])
```

# Predict

```
ynew = model.predict(Xnew)  
plt.scatter(X[:, 0], X[:, 1], c=y, s=50, cmap='coolwarm')  
lim = plt.axis()  
plt.scatter(Xnew[:, 0], Xnew[:, 1], c=ynew, s=20, cmap='coolwarm', alpha=0.2)  
plt.axis(lim);
```

```
ynew[0:10]  
array([1, 1, 1, 1, 1, 1, 1, 0, 1, 1])
```

# When to Use Naive Bayes

Generally not as good as more complex model

## Advantages

They are extremely fast for both training and prediction

They provide straightforward probabilistic prediction

They are often very easily interpretable

They have very few (if any) tunable parameters

# When to Use Naive Bayes

When the naive assumptions actually match the data (very rare in practice)

For very well-separated categories, when model complexity is less important

For very high-dimensional data, when model complexity is less important

# Text Analysis & Bayes

How to use Bayes to analysis text?

Assume English has 5 words - at, bat, cat, dog, enough

Convert sentences into vectors

bat at dog [0, 1, 0, 1, 0]

enough dog enough [0, 0, 0, 1, 2]

sad dog sad [0, 0, 0, 1, 0]

# Text feature extraction

Tokenizing strings

Give an integer id for each possible token

Counting the occurrences of tokens in each document.

Normalizing and Weighting

Give less weight to tokens in majority of samples / documents

# Reviews

Group the reviews

Positive

Neutral

Negative

Collect all words in all reviews

Drop unimportant words - a, the, at, ...

Stop words

Convert words to their root

laughing, laughed -> laugh

ran, run -> run

Drop punctuation

...

Order the remaining words

Convert each review into vector

Review Groups become set of vectors

Use Bayes to predict which group a new review is in

# Issue - sparse vectors

All the text may have 100,000's of distinct words

A single message may only have 40 words

message converts to a vector of size 100,000

But only has 40' ones in it

Scikit represents the vector using a sparse representation

# How to Convert to Words to Vectors

CountVectorizer

Text documents -> matrix of token counts

HashingVectorizer

TfidfTransformer

Count matrix -> normalized tf or tf-idf representation

TfidfVectorizer

Text documents -> normalized tf or tf-idf representation

Same as CountVectorizer + TfidfTransformer

Scikit learn functions

Tokenize

Remove stop words

Drop punctuation

~~Convert words to roots~~

Vectorize

# Tf - Term frequency

tf(term, document) or tf(t,d)

Raw count  $f(t,d)$

Boolean

tf(term, document) = 1 if term in document, 0 otherwise

Length adjusted

$f(t,d) / (\text{number of words in } d)$

Logarithmically scaled

$\text{tf}(t, d) = \log(1 + f(t,d))$

# idf - Inverse Document Frequency

idf - Inverse Document Frequency

Measure of how much information a word provides

If word is in every document - provides no information

Multiple ways to compute  $\text{idf}(t,D)$

$D$  = set of documents

# tf-idf

$$\text{tfidf}(t,d,D) = \text{tf}(t,d) * \text{idf}(t,D)$$

High value is reached when

- Term occurs a lot in a document

- The term does not occur in many documents in the corpus

As a term appears in more documents in the corpus

- tf-idf get closer to zero

# CountVectorizer

Counts the words

```
from sklearn.feature_extraction.text import CountVectorizer
vectorizer = CountVectorizer()
```

```
corpus = [ 'This is the first document.',
           'This is the second second document.',
           'And the third one.',
           'Is this the first document?']
```

```
X = vectorizer.fit_transform(corpus)
```

```
vectorizer.get_feature_names() #['and', 'document', 'first', 'is', 'one', 'second', 'the', 'third', 'this']
```

```
X.toarray()
```

```
array([[0, 1, 1, 1, 0, 0, 1, 0, 1],
       [0, 1, 0, 1, 0, 2, 1, 0, 1],
       [1, 0, 0, 0, 1, 0, 1, 1, 0],
       [0, 1, 1, 1, 0, 0, 1, 0, 1]]...)
```

```
vectorizer.vocabulary_.get('document')
```

---

1

```
vectorizer.transform(['Something completely new.']).toarray()
```

```
[0, 0, 0, 0, 0, 0, 0, 0, 0]
```

# CountVectorizer Methods

<code>build_analyzer()</code>	Return a callable that handles preprocessing and tokenization
<code>build_preprocessor()</code>	Return a function to preprocess the text before tokenization
<code>build_tokenizer()</code>	Return a function that splits a string into a sequence of tokens
<code>decode(doc)</code>	Decode the input into a string of unicode symbols
<code>fit(raw_documents[, y])</code>	Learn a vocabulary dictionary of all tokens in the raw documents.
<code>fit_transform(raw_documents[, y])</code>	Learn the vocabulary dictionary and return term-document matrix.
<code>get_feature_names()</code>	Array mapping from feature integer indices to feature name
<code>get_params([deep])</code>	Get parameters for this estimator.
<code>get_stop_words()</code>	Build or fetch the effective stop words list
<code>inverse_transform(X)</code>	Return terms per document with nonzero entries in X.
<code>set_params(**params)</code>	Set the parameters of this estimator.
<code>transform(raw_documents)</code>	Transform documents to document-term matrix.

# TfidfVectorizer

```
from sklearn.feature_extraction.text import TfidfVectorizer  
vectorizer = TfidfVectorizer()
```

```
corpus = [ 'This is the first document.',  
          'This is the second document.',  
          'And the third one.',  
          'Is this the first document?']
```

```
X = vectorizer.fit_transform(corpus)  
vectorizer.get_feature_names()
```

```
import pandas as pd  
pd.DataFrame(X.toarray(), columns=vectorizer.get_feature_names())
```

Subject: SI Clock Poll - Final Call

Summary: Final call for SI clock reports

Keywords: SI,acceleration,clock,upgrade

Article-I.D.: shelley.1qvfo9INnc3s

Organization: University of Washington

Lines: 11

NNTP-Posting-Host: carson.u.washington.edu

A fair number of brave souls who upgraded their SI clock oscillator have shared their experiences for this poll. Please send a brief message detailing your experiences with the procedure. Top speed attained, CPU rated speed, add on cards and adapters, heat sinks, hour of usage per day, floppy disk functionality with 800 and 1.4 m floppies are especially requested.

I will be summarizing in the next two days, so please add to the network knowledge base if you have done the clock upgrade and haven't answered this poll. Thanks.

>If there's anyone out there who has this program and actually finds it

>useful, enlighten me!

>Pete

There are some tricks to installing ATM to windows... install them first to dos, then run the ATM control panel to get them into windows.

---

42 The best reason for ATM is that Adobe IS the standard. Truetype is a failed MS venture to undercut Adobe when Adobe was being nasty about

# The Prediction

```
train.target_names[labels[1]]
```

```
'comp.graphics'
```

So it got location 1 correct

But how many are there in the test data?

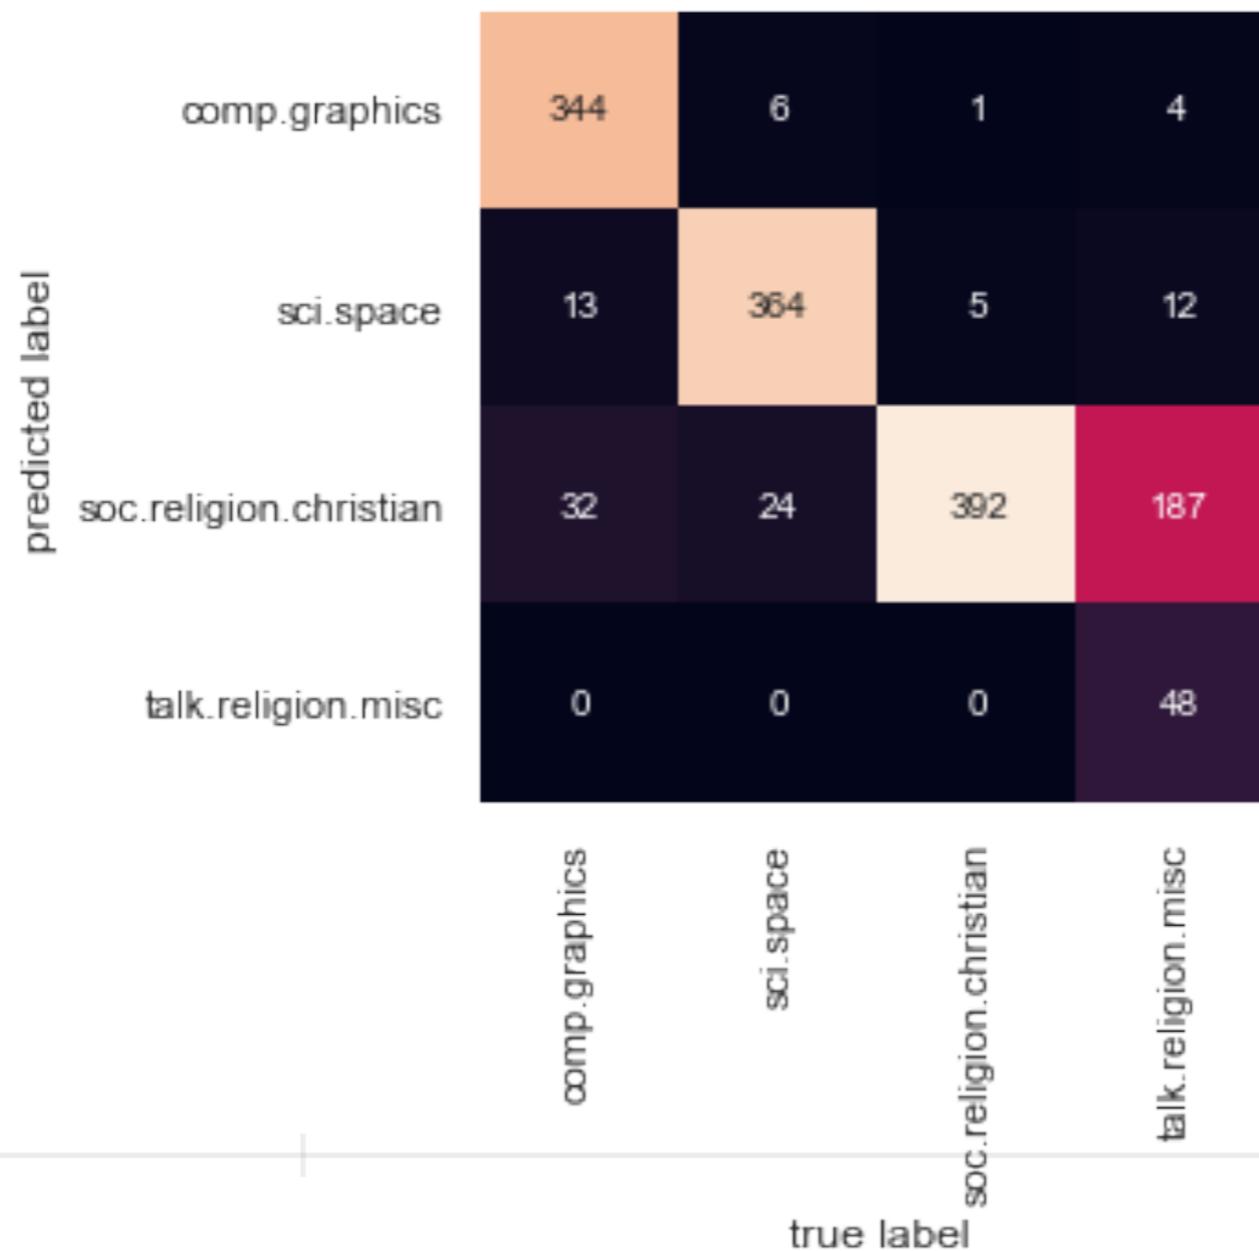

```
test.target.shape
```

```
(1432,)
```

```

from sklearn.metrics import confusion_matrix
error_matrix = confusion_matrix(test.target, labels)
sns.heatmap(error_matrix.T, square=True, annot=True, fmt='d', cbar=False,
            xticklabels=train.target_names, yticklabels=train.target_names)
plt.xlabel('true label')
plt.ylabel('predicted label');

```

# Examining Where Classification Failed

Or how do you write confusion\_matrix

test.data

Actual data

test.target

Actual classification

labels.data

Predicted classification

[ ..see previous article on this debate for the rests.. ]

---

I can see XV-3.00 agree with my view in cases you don't -- even I say  
48 my personal opinion (as above), it doesn't mean that it is not most
